

To remove the All-in-One Touchscreen, use a 3 mm Allen wrench or hex bit and remove the 8 screws from the center plastic part.

Take a picture of the wires on your bike to remember how to reconnect everything. Disconnect all the wires from the AIO.

Remove the 4 screws securing the AIO to the bike frame. Some bikes have an extra steel mounting plate so there will be 4 nuts to remove.
The AIO weighs about 25 pounds – recommended to have a second person to help lift it off the bike.

These USB extenders are not necessary – you can discard them.
Cut the zip ties.

If there is a steel mounting plate, remove it. Do not ship it.
